Specialized Pipeline Services

Flowfix Delivers Reliable Solutions for Critical Pipeline Intervention
& Mechanical Services.

Flowfix is Committed to safety, quality workmanship and reliable execution across industrial and utility pipeline systems.

Pipeline Materials We Work On

CS | MS | HDPE | DI | PVC | CPVC

ABS | Copper | GRP | GRE

WHY FLOWFIX

We deliver specialized pipeline engineering solutions for maintenance, modification and repair works without shutdown.

Our practical field-based approach helps clients reduce downtime, maintain operations and achieve efficient project execution.

“Without Shutdown, Save Time, Save Cost”

CORE SERVICES

UNDER PRESSURE DRILLING / HOT TAPPING

Hot tapping is a specialized method used to create branch connections or modifications on existing pipelines without shutdown allowing the system to remain in operation.

Flowfix provides safe and precise hot tapping services for various pipeline systems ensuring reliable execution with minimal disruption to ongoing operations.

Our solutions are suitable for a wide range of pipe materials including CS, MS, HDPE, DI, and other industrial piping systems.

“Safe isolation solutions for pipeline works”

PIPE FREEZING

Pipe freezing is a specialized isolation method used to temporarily stop flow inside a pipeline by creating an ice plug allowing maintenance, modification or repair works to be carried out without shutdown.

Flowfix provides safe and controlled pipe freezing solutions for various pipeline systems helping clients complete critical works efficiently while maintaining system operation.

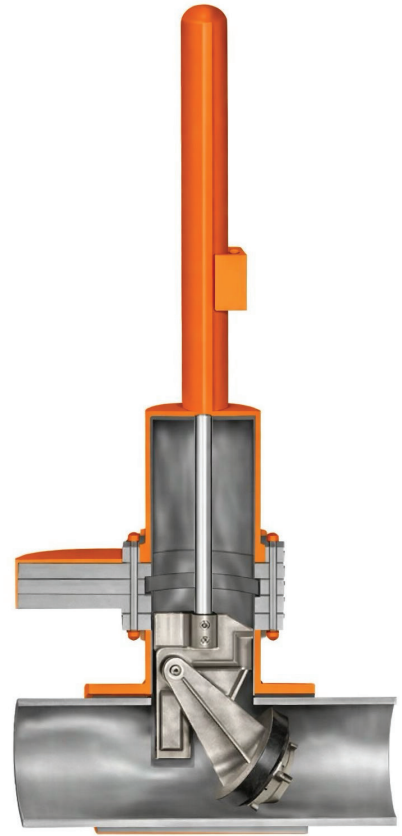

Our pipe freezing services are suitable for a wide range of applications and pipeline materials depending on site conditions and service requirements.

LINE STOPPING / FLOW STOPPING

Line stopping also known as flow stopping. It is a specialized method used to temporarily isolate a section of pipeline allowing maintenance, modification or repair works to be carried out without shutdown.

Flowfix provides safe and reliable line stopping solutions for a wide range of pipeline systems helping clients to maintain operations while completing critical pipeline works efficiently.

Our line stopping services are carried out with practical field execution, ensuring controlled isolation, reduced downtime and dependable performance under site conditions.

“Reliable pipeline engineering solutions you can trust”

THERMOWELL INSERTION

Thermowell insertion is a specialized service used to install temperature sensing points on existing pipelines, allowing monitoring and measurement requirements to be achieved without shutdown.

Flowfix provides safe and precise thermowell insertion solutions for a wide range of pipeline systems, supporting operational monitoring while maintaining system continuity.

Our thermowell insertion services are carried out with practical field execution, ensuring reliable installation, accuracy, and minimal disruption to ongoing operations.

OTHER SERVICES

GAS BAG SERVICES

Gas bag services are used to temporarily isolate or control flow within a pipeline allowing maintenance, modification or repair works to be carried out safely and efficiently.

Flowfix provides reliable gas bag solutions suitable for selected pipeline applications, supporting controlled isolation and practical field execution under site conditions.

"Safe isolation solutions for pipeline works"

PIPE CUTTING

Pipe cutting is a specialized service used for the controlled removal or modification of pipeline sections during maintenance, replacement or system alteration works.

Flowfix provides safe and precise pipe cutting solutions for a wide range of pipeline systems ensuring efficient execution and reliable results based on site requirements.

"Controlled Cutting Solutions for Pipeline Modification Works"

ON-SITE WELDING / COMMISSIONING

On-site welding and commissioning services are essential for pipeline installation, modification, repair and final system preparation before operation.

Flowfix provides professional field welding and commissioning support ensuring quality workmanship, proper system integration and dependable performance under site conditions.

"Reliable Field Support for Installation and System Readiness"

PRESSURE TESTING / HYDRO TESTING

Pressure testing and hydro testing are used to verify the strength, integrity and leak tightness of pipeline systems before operation or after modification works.

Flowfix provides reliable testing solutions to ensure pipelines and related systems to meet operational and safety requirements with accurate and controlled test procedures.

"Reliable Testing Solutions for System Integrity"

ENCAPSULATION SERVICES

Encapsulation services are used to contain or seal leaking joints, fittings or pipeline components helping to maintain system safety and operational continuity.

Flowfix provides practical encapsulation solutions for selected pipeline applications, supporting controlled leak management and reliable field performance.

"Practical Solutions for Leak Containment and Pipeline Support"

PRODUCTS

Under Pressure Tees

Specially designed fittings used to create branch connections on existing pipeline systems, supporting hot tapping and related works without shutdown.

Flange Adaptors

Designed to provide secure and reliable connections between flanged pipeline components, ensuring proper alignment, sealing, and system integrity.

Dismantling Joints

Provide adjustable connections between flanged pipeline components, allowing easy installation, removal, and maintenance of valves and equipment.

Gate Valves

Used for reliable isolation and flow control in pipeline systems, supporting safe operation and efficient maintenance activities.
